HOW TO CLEAN YOUR MATERIALS

HOW TO CLEAN YOUR MATERIAL USING CREAM CLEANER

What you'll need:

- Soft brush or sponge
- Damp cloth & water
- Clean, dry cloth
- Cream cleaner suitable for plastic surfaces

Steps:

1. Before applying the cream cleaner, ensure that the surface of your material is free from any loose debris or dirt. You can use a soft brush or sponge to gently remove any surface dirt.
2. Squeeze a small amount of cream cleaner onto a damp cloth. Make sure the cloth is not soaking wet, as excess water can dilute the cleaning power of the cream cleaner.
3. Gently spread the cream cleaner onto the surface of the material using the damp cloth. Work in small sections if necessary, ensuring thorough coverage.

4. Allow the cream cleaner to sit on the surface for a few minutes. This gives it time to penetrate and loosen any stubborn stains or grime. Remember to always follow the manufacturer's instructions and test any cleaning product on a small, inconspicuous area before applying it to the entire surface.

5. If there are particularly stubborn stains, you can use a soft brush or sponge to gently scrub the affected areas. Be careful not to scrub too hard, as this could scratch the surface.

6. After allowing the cream cleaner to work its magic, rinse the surface thoroughly with water. Use a clean, damp cloth to wipe away any traces of the cream cleaner.

7. Once the surface is clean, inspect it to ensure that all dirt and residue has been removed. If there are still stubborn stains remaining, you may need to repeat the process or target those areas specifically with a bit more cream cleaner and gentle scrubbing.

8. After rinsing, it's important to dry the surface thoroughly to prevent water spots or streaks. Use a clean, dry cloth to wipe away any excess moisture.
